		Sprint 2	70%

Current Unit Grade: 80.0%

Additional Comments

Things done well

- Excellent use of various CSS properties such as background-size, display, and text-decoration.
- Good work linking in your stylesheets.
- Excellent work starting to apply BEM conventions throughout your code.
- The visual design is off to a good start.

Opportunities to improve

- Good work linking global.css to both your HTML files. Ideally, common CSS, such as the styles for the top navbar, should be placed in global.css. This way, you can avoid rewriting the same CSS rulesets multiple times.
- Great work starting to use BEM. However, names like `navdiv__shop-now--blue` could be improved for clarity by using more descriptive names such as `navbar__link--highlight` for example.

- Avoid excessive specificity in your CSS. The selector `li.navdiv__shop-now--blue` is only necessary due to the high specificity of `.navdiv a`. Ideally, the descendant combinator (`" "`) should be avoided altogether. Simplify your selectors for better maintainability.
 - Paths are correct for linking CSS; however, there are issues with navigation between pages, specifically from Menu to Landing. The link `href="/samiha-samin-coffeeshop/index.html"` should be `href="/index.html"`.
 - The class `.nitroproducts__card` would be more appropriately named `card-group` to better reflect its purpose and improve clarity.
 - Avoid using separate classes like `.nitroproducts__coffeebeans`, `.nitroproducts__cold-brew`, and `.nitroproducts__inhousebrew`, as they share the same rulesets. Instead, use a single class (e.g., `card`) for all relevant elements to simplify and streamline your CSS.
 - The submission includes extra files, such as `pages/Coffee Shop 2 - Markup Language.txt`. Please remove unnecessary files before submitting.
 - Your code's indentation is inconsistent. Correcting it will improve readability and maintain a clear structure. Prettier can help.
 - There are some visual discrepancies:
 - Footer is not aligned, and there is a horizontal overflow due to `footer h3` width: 100% and margin-left.
 - The navbar differs between pages. Ensure consistency by reusing your CSS.
 - Ensure `.description` has a defined width for proper layout and alignment.
-
